## RESIDENTIAL SCHEDULE PREFACE

In preparing a schedule for mass appraisal purposes, there are two goals we are all attempting to reach. First, we must have uniformity among properties, and, second we must base our uniformity on fair and reasonable market value.

The Residential Schedule appearing on the following pages is designed to give the assessor/appraiser a uniform approach to the value of improvements. This schedule assumes a building of average construction for which the basic specifications are included later in this preface. Any variation from these specifications which would affect the replacement cost must be adjusted for by using the additions and deductions appearing in the schedule or by adjusting the grade. Nearly all parts of this, or any schedule, are mechanical in use, with few areas for variations.

It is these variables, namely grade and depreciation (however caused) which allow the assessor/appraiser to arrive at fair and reasonable market value and still maintain equalization. In order to effectively use this schedule we must first agree on two basic concepts: (1) that the value of improvements is the difference between market value and land value; and (2) that the residential schedule is merely a vehicle by which we can arrive at a uniform value of improvements within a given area.

Let us first discuss grading:

There are seven basic numerical grades of dwellings:

- E. Executive Quality
- 1. Superior Quality
- 2. High Quality
- 3. Good
- 4. Average
- 5. Below Average
- 6. Sub-standard

Following is a list of some of the many factors which must be considered in grading a dwelling:

Quality - This would include both the quality of materials and the quality of workmanship.

Quantity – The accumulation components can impact the grade. A dwelling with more built-in cabinets than normal or perhaps built-in book shelves, etc. would require a higher grade than a similar dwelling without these extras.

Design - The basic schedule is calculated on a rectangular dwelling with very straight lines. Any variation in design, ceiling heights, shape or character must be considered in the grade.

Desirability - Two dwellings can be identical in square footage and of identical quality but one will market better than the other. It has that “certain something” that appeals to the buying public. It may be the interior layout, the exterior design, type of kitchen or any number of things.

Fenestration - Is the placement of windows and doors in a dwelling. The quality and cost of these items varies significantly. Not only should the quality be considered, but the quantity of doors and windows should also be considered in the grade.

The assessor/appraiser is given considerable latitude to and from the average. All properties are first priced according to the basic specifications, taking into consideration size, story height and exterior wall covering. By adjusting the grade the assessor/appraiser is designating his opinion as to the amount of superior or inferior factors as listed above. The result of this grade is the adjusted replacement cost.

## RESIDENTIAL SCHEDULE PREFACE (Continued)

The second variable by which the replacement cost can be adjusted is depreciation. It has been noted that the use of the cost approach established the upper limit of the value of an improved piece of property. Normally, however, the market value of the piece of property is less than its present replacement cost. This difference between the replacement cost of a property and its current market value can be attributed to depreciation. Assessor/appraisers generally recognize two basic types of depreciation: (1) that which is due to physical cause, and (2) that which is due to obsolescence.

Physical depreciation results from factors which affect the physical condition of an improvement. A loss in value due to normal wear and tear, age or natural elements is considered to be a physical depreciation. The degree of physical depreciation may be contingent upon factors such as the original quality of an improvement and the extent to which an improvement has been maintained. Because the degree of physical depreciation cannot be determined solely by schedules or guidelines, the judgment of the assessor/appraiser is extremely important in determining physical depreciation.

The assessor/appraiser must bear in mind that average physical depreciation must be determined on the basis of the sum of the component parts of an improvement. For example, a roof may have a 20 year life, whereas a foundation may have a 200 year life. Similarly, if a thirty-year old dwelling has had substantial remodeling, the amount of depreciation allowed must be adjusted to reflect such improvements.

Oftentimes, however, physical depreciation alone cannot explain the difference between the replacement cost of a piece of property and its current market value. The value of certain properties may also be affected by a second type of depreciation: obsolescence.

Whereas physical depreciation represents a loss in value due to factors affecting the physical condition of a structure, obsolescence represents a loss in value due to other causes. Obsolescence itself can further be divided into two distinct types: (1) functional obsolescence, and (2) economic (external) obsolescence.

Functional obsolescence represents a loss in value arising from what might be considered factors inherent within the property itself. Poor room arrangement, too many or too few rooms in a house, obsolete architectural design, or outdated plumbing are all factors which would contribute to the functional obsolescence of the property.

For example, let us consider a dwelling in which the bathroom is located directly off the dining area. This dwelling may have the same physical value as a dwelling in which the bathroom facilities are more appropriately located. However, we must recognize a difference in valuation between these two properties. This difference would be attributed to the fact that the first house suffers a degree of functional obsolescence due to the location of the bathroom.

Whereas functional obsolescence pertains to a loss of value due to factors within the property itself, economic obsolescence is a loss in value caused by factors or circumstances outside the property limits. For example, the construction and opening of a commercial or light industrial establishment on the corner of a quiet street consisting previously of residential properties would tend to make these properties less valuable. The loss in value of these properties which can be attributed to the undesirable effects due to the presence of the commercial or industrial establishment can be considered economic obsolescence. Similarly, a property which is located in a declining or deteriorating neighborhood, may have the same physical value as a property located in a more desirable section of town, but have a lower market value because of the area in which it is located. Again, this difference or loss in value may be attributed to economic obsolescence of the property.

A common example of economic obsolescence is the small rural community that existed only because of the poor transportation facilities to more major shopping facilities. Many of these small rural communities have been dormant or losing value in the last several decades. It is often determined in these communities that the entire town should receive a "blanket" economic obsolescence.

## RESIDENTIAL SCHEDULE PREFACE (Continued)

In summary, physical depreciation refers to loss in value due to the elements and use. Functional obsolescence refers to loss in value due to factors within the property limits and economic obsolescence refers to loss in value due to factors outside of the property limits.

The built-up residential section is designed for the use of the assessor/appraiser rather than for the use of the contractor or the building inspector who may need more specific information. It departs from most other cost manuals in that no attempt has been made to illustrate specific material differences between low grade homes and high grade homes. Certainly, variations in materials do exist among homes, but they do not necessarily differ among the various grades of homes.

To state that an average quality home generally has two coats of paint on 1/2" drywall over 2" x 4" x 16" o/c wood stud partitions is pure folly. A poor quality home and a good quality home can have the identical items as an average quality home. What makes itemized descriptions even more superfluous is that in order to know that 1/2" drywall over 2" x 4" x 16" o/c wood stud partitions are present, the assessor/appraiser would either have to study the house during construction or take electrical outlet boxes off the walls to study its interior components, as well as chip paint for analysis as to whether it consists of one, two, or three coats.

Obviously, the use of special specification for each grade in a manual of this type is unrealistic. We must view residential construction through the eyes of the consumer, and there are indeed few homeowners who can detect a difference between 3/8" and 1/2" drywall. It is only when a multitude of variables are weighed that quality becomes evident. For this reason, almost anyone can distinguish between a tract home and a superior quality home, even though he may not be able to specify each component used in their construction.

Quality, therefore, is the sum of material, workmanship, and design. These sums are expressed as grades for use by the assessor/appraiser. We hope that the use of the brief grade guidelines appearing on the following pages, used with the photographs which accompany them, will adequately guide the assessor/appraiser in determining the proper grade of residential property.

### E (EXECUTIVE) GRADE

#### A 2 STORY + BASEMENT BRICK DWELLING

E Grade: Executive grade dwellings will be individually designed with many varied interior appointments. They will normally exhibit extensive ornamentation or special design features of excellent quality materials and workmanship. These architecturally unique dwellings will many times consist of imported finishes. High ceilings and expansive foyers are also characteristics which will be common in this grade of home. Executive grade dwellings are normally prestige structures. They are generally built for those with high incomes. The high end executive (E + 100 and above) home will typically be built without regard for cost.

### 1 GRADE

#### A 2 STORY + ATTIC + BASEMENT BRICK DWELLING

1 Grade This is a custom built, architecturally designed home, having good materials and workmanship. This home will lack the unique features of an executive grade home. This home is usually large with spacious rooms, several bath facilities, a good heating system, and a good electrical system with numerous outlets. Closets are usually walk-in type. Kitchen has many built-in features (if of newer construction) and an abundance of cabinets. Bathrooms will have high quality fixtures, good vanity, and probably a special dressing area. Exterior is good quality siding, brick, or stone. There are also numerous windows.

## 2 GRADE

### A 2 STORY + ATTIC + BASEMENT STONE DWELLING

2 GRADE This also is usually an architecturally designed, custom built home with good materials and workmanship. Very similar to a 1 grade home, but on a more conservative scale. This is a more practical home than a 1 grade home, having more than sufficient plumbing fixtures. Likewise, there is good heating and electrical service. Interior finish will be of plaster or drywall with good trim. Kitchen will have built-in features with more than adequate cupboard space and counter tops. Bathrooms and toilet rooms will usually have good quality fixtures. This is an excellent home but not as pretentious as a 1 grade.

### 3 GRADE

#### A 2 STORY + BASEMENT FRAME DWELLING

3 Grade A 3 grade dwelling is generally a custom or speculation home lacking architectural frills but basically of good practical design and layout. Workmanship and materials are barely above an average type home but it will have some extra design and special features not found in the average home. It will normally have good drywall or plaster walls, hardwood floors (or wall to wall carpeting), and also better than average kitchen cabinets, plumbing facilities, and closet space. This is often referred to as an intermediate grade because it will be a 2 grade design and layout but 4 grade workmanship and materials.

## BASIC SPECIFICATION FOR SCHEDULE PRICES

The following specifications are for an average residential dwelling (4 grade) which offers few extras and has very little architectural design. With today's variables in construction materials it would be impossible to write any specifications that would describe a majority of homes. Therefore, we must, in our minds, think in terms of equivalents. For example, we may have a dwelling which meets these specifications and we place a 4 under the grade. We may also have a house next door which meets very few of these specifications but the various items are equivalent in quality and cost and therefore we would still grade it as a 4.

FOOTINGS - Reinforced concrete.

FOUNDATION - 8" reinforced concrete or equivalent, waterproofed exterior.

WALLS - Vinyl lap siding or equivalent on building wrap paper on sheathing. 2" x 6" wood studs, 16" o.c. with R-19 fiberglass insulation. 1<sup>3</sup>/<sub>8</sub>" double hung windows or equal, with approximately one window for each 15 L.F. of wall. Two entry doors with decorative trim at front. Screens and weather stripping throughout.

ROOF - Gable roof with a 3/12 to 4/12 pitch. Average weight asphalt shingles on felt paper on wood roof decking. 2" x 6" wood rafters, 2' o.c. or equal, 11" of blown-in insulation or equivalent, boxed eaves, flashing, gutters and downspouts.

FLOORS - 3½" concrete basement floor with cement trowel finish. Upper floors are average grade carpet and linoleum on ¾" tongue & groove O.S.B. board or equivalent plywood on 2" x 8" to 2" x 12" wood joist (depending on span) 16" o.c.

INTERIOR FINISH - Two coat paint on drywall. 2" x 4" x 24" o.c. wood stud partitions. Stained and lacquered trim and baseboard, hollow core interior doors, adequate closet areas in each bedroom, coat closet, and linen closet. Average quality kitchen cupboards and counter space. One average quality bathroom vanity base, towel rack and toilet paper dispenser. Softwood basement stairway and carpet on softwood staircase with balustrade to second floor.

ELECTRIC - Armored cable, Romex or non-metallic sheathed cable. Adequate outlets and average quality fixtures.

HEATING - Forced hot air furnace with duct work distribution system fired by gas with thermostat control.

PLUMBING - One three-fixture bathroom, one kitchen sink, one hot water tank, laundry facilities, and copper piping or equivalent. All fixtures are of ordinary quality.

#### 4 GRADE

A 2 STORY + ATTIC + BASEMENT FRAME DWELLING

4 Grade A Grade 4 dwelling is an average home in every way. It meets or exceeds all loan requirements and is often referred to as a development type home. This does not mean this home cannot be custom built but only refers to the basic quality. (Detailed specifications for a 4 grade appear on the preceding page.)

## 5 GRADE

### A 1 STORY + BASEMENT FRAME DWELLING

5 Grade This low cost home is generally of minimum specifications, barely meeting loan requirements. It may outwardly, occasionally, resemble a 4 grade but lacks any “extras”. Usually of straight rectangular design with no lines or design. Drywall or plaster interior finish with minimum softwood trim, low quality carpeting or softwood flooring. Minimal plumbing, heating and electrical outlets. The kitchen has no built-in features and minimum cupboard and counter space. In certain areas this is often a slab home, or a low quality pre-fabricated manufactured home.

A 1 STORY  
FRAME DWELLING

## 6 GRADE

### A 1 STORY FRAME DWELLING

6 Grade Often referred to as sub-standard housing. This home seldom will pass loan requirements and is often owner built using inferior or used materials and poor workmanship. Interior finish is plaster, wallboard or low quality drywall, softwood floors, little or no trim, wall or floor furnace heating, low quality kitchen cupboards (usually set -in type), roll roofing or lightweight shingles, exterior walls are usually single siding (often covered with asphalt shingles). This house is often on the outskirts of town or in the country and is usually an older home. Few 6 grade homes are being built today.

The 6 grade schedule is also designed to be used as a summer cottage schedule. Normally 6 - 20 would be as inferior of quality construction that could be habitable, however, the assessor/appraiser may use 6 - 25 for an unfinished interior and 6 - 30 for unfinished interior and mud sills. Dwellings or cottages having a lesser value than the 6 - 30 should be given a sound value for field priced.

**"A-FRAME" DWELLINGS**

In valuing "A-frame" dwellings, the assessor/appraiser should follow the same listing and pricing procedures as are used for conventional residential properties. The base specifications for conventional dwellings are also applicable to "A-frame" dwellings. "A-frame" dwellings should be graded in the same manner as are conventional dwellings, and similar consideration given to depreciation and obsolescence.

Lofts are to be considered as attics or half-stories, depending upon the area and dormers. Page 7-44 should be used in determining the story height of "A-frame" buildings in the same manner as for conventional dwellings.

A sample listing and pricing for an "A-frame" dwelling appears below.

"EARTH SHELTERED" AND "BERMED" DWELLINGS

For purposes of this manual, "Earth Sheltered" and "Bermed" dwellings are described as follows:

"Earth Sheltered" Dwellings – A one story dwelling built into a side hill where the rear wall, side walls and roof are constructed of heavy reinforced concrete and covered by earth. The front (or exposed exterior wall) is usually of wood frame, brick or structural glass construction.

"Bermed" Dwellings – A one story dwelling where the rear wall and side walls are constructed of concrete block or reinforced concrete and covered by earth. The front (or exposed exterior wall) is usually constructed of brick or wood frame. The roof is a conventional gable or hip roof with asphalt shingles or equivalent.

"Earth Sheltered" and "Bermed" dwellings should be priced from the Bermed and Earth Home Schedules found on page 60. The appropriate adjustments should be applied in the same manner as conventional residential properties.

The following photographs of "Earth Sheltered" and "Bermed" dwellings are to be used as a guide for grading purposes, however, the grade of these dwellings will be influenced greatly by the quality of construction and interior finish. The interior quality and appearance should weight heavily on the assessor/appraiser's opinion of grade.

A sample listing and pricing for an "Earth Sheltered" dwelling is as follows:

1. OCCUPANCY	TYPE	CONSTRUCTION	SIZE - AREA	GRADE	YEAR BUILT	REMOD.	COND.	REPLACEMENT VALUE	PHYS. DEPR.	PHYSICAL VALUE	OBSOL.	ACTUAL VALUE

"LOG" DWELLINGS

In valuing "Log" dwellings, the assessor/appraiser should follow the same listing and pricing procedures as are used for conventional residential properties. Most "Log" dwellings are constructed of either pine or cedar logs. The base prices for log homes are found on pages 51 thru 59.

Adjustments to the base cost (air conditioning, basement finish, additional plumbing, etc.) should be applied in the same manner as conventional residential properties.

A sample listing and pricing for a "Log" dwelling appears below.

1. OCCUPANCY	TYPE	CONSTRUCTION	SIZE - AREA	GRADE	YEAR BUILT	REMOD.	COND.	REPLACEMENT VALUE	PHYS. DEPR.	PHYSICAL VALUE	OBSOL.	ACTUAL VALUE

## “MANUFACTURED” DWELLINGS

Manufactured (formerly known as Mobile) Homes are residential structures built on a steel undercarriage with necessary wheel assembly to be transported to a permanent or semi-permanent site. The wheel assembly can be removed when placed on a permanent foundation, but the steel undercarriage remains intact as a necessary structural component.

The “Manufactured” dwellings schedule is to be used for mobile type manufactured homes and is not intended to be used for modular or panelized manufactured homes.

Mobile Homes built after June 15, 1976 must meet the Federal Mobile Home Construction and Safety Standards as outlined in Title VI, Housing and Community Development Act of 1974. A HUD seal certifying compliance with these standards must be displayed on each unit.

Manufactured (Mobile) Homes should be priced from the “Manufactured Homes” schedule found on pages 73 through 75. Adjustments to the base price should be applied in the same manner as conventional residential properties.

### Grading Manufactured Homes

5 Grade - Mobile Homes built with prefinished lightweight corrugated aluminum exterior walls, corrugated metal arched roof and low quality printed hardwood or plywood paneling interior finish. Most Mobile Homes constructed prior to 1976 will fall within this grade.

4 Grade- Manufactured (Mobile) Homes built with vinyl lap siding or equivalent on wood studs. Gable (3/12 pitch) roof with asphalt shingles. Vinyl wall coverings on gypsum.

The following guide can be used to determine the proper grade for Manufactured Homes above a 4 grade.

<u>Item</u>	<u>Percent of Increase To Base 4 Grade Replacement Cost</u>
Textured Drywall Interior	6 to 11%
Textured Drywall Interior (units with basement)	4 to 8%
Wood Siding	5 to 6%
Wood Siding (units with basement)	4%
Extra Roof Pitch	3%
Extra Roof Pitch (units with basement)	2%

## ADDITIONAL RESIDENTIAL STRUCTURES

Pre-Fabricated Homes: Prefab homes can vary greatly in quality and design. Low quality prefab dwellings with wood panel interior walls and drywall cathedral ceilings with batten strips should be priced from the Manufactured Home Schedule. Better quality pre-fabricated homes meet the same building code requirements as standard stick built homes. In many cases it is very difficult to see any difference in these homes when compared to a standard stick built home. These homes should be priced from the Residential Schedule.

Condominiums: (A form of ownership in which each owner owns the fee to the individual unit, and a percentage of the fee to the common areas.) Condominium units are a unique type of residential occupancy and ownership. By design these units incur additional costs not typically found in other residential properties. These additional costs include marketing, filing and development of horizontal property regime and Homeowners Association costs during construction and marketing phases.

The replacement cost of condominium units should be determined from the appropriate Residential Schedule utilizing the individual unit square footage. Appropriate adjustments should be applied in the same manner as used in typical residential properties.

Replacement costs of common areas such as, hallways, elevators, banquet and/or dining area, pools and pool enclosures should be determined from the appropriate manual section. Once the total replacement cost of all common area components has been determined it should be allocated to each individual unit utilizing the proper percentage of ownership as indicated by the horizontal property regime.

Grading of condominiums presents a unique challenge to the assessor/appraiser. Grades not only vary from one condominium complex to another but can vary within the same condominium complex. Items which can cause an individual unit to vary in grade from a similar unit within the same condominium complex are: location of unit, unit view, layout, end units vs. interior units, and unit position in a multi-story structure.

The assessor/appraiser is encouraged to closely analyze each condominium unit to determine the proper grade.

Townhouses: Price from appropriate Residential Schedule.

3 GRADE

4 GRADE

5 GRADE

6 GRADE

### TYPICAL GARAGE SPECIFICATIONS

2 Grade - This is a good quality garage. It will be similar to a 3 grade but will typically include additional interior finish not present in a 3 grade.

3 Grade - This is a good quality garage, generally of newer construction or with a good quality residence. This garage has very similar building specification as a grade 4, but will display better quality design, materials and workmanship.

4 Grade - This is an average quality garage. The building specifications include a concrete slab floor, siding on sheathing walls on 2" x 4" studs 24" o.c., asphalt shingle roof, window(s), one entrance door, overhead door(s) and electricity.

5 Grade - This is a lower quality garage than a grade 4 and is generally found in older areas or in low quality developments. Single wall siding, 2" x 4" studs 24" o.c., roll roofing or light weight shingles, thin concrete or asphalt floor, no or minimal electric, low quality windows and entrance door (if any), low quality overhead door or hinge door.

6 Grade - This is similar to a shed. Roll roofing, single siding, no floor, no or minimal electric, usually no windows or entrance door, low quality hinge doors or none.

NOTE: Add 1 grade (i.e. from a 4 grade to a 3 grade) to garages with insulation, finished interiors, and heat.

## LISTING INSTRUCTIONS

### Land Record

*"Improved Street"* refers to paved street with curb, gutter, and sidewalk (if in area where sidewalks are desirable).

*"Semi-improved Street"* refers to paved street without curb, gutter, and/or sidewalk.

*"Unimproved Street"* refers to dirt, gravel, or oil street.

*"No Street"* refers to a street which appears on maps only and does not exist (paper street).

Topography references (level, high, low) are always considered in relationship to the street.

Utilities refer to utilities which are available to the property.

#### 1. Occupancy

Single Family - Check for all residences with only one family.

Family Duplex - For the purpose of this manual a duplex is a structure containing two side by side living units. Each being completely self sufficient and containing separate entrance, kitchen, heating, electrical service, sewer and water. Indicate "2" in box provided.

Family Flat - for the purpose of this manual a flat shall be a structure built to contain more than one family. These family units can be side by side or over-under or a combination of both. Each unit should have private entrance and complete kitchen. Can also have separate heating facilities. Indicate number of flats in box provided.

Family Conversions generally refer to an extra family or families added to a structure which was not designed with this in mind. A good example is a single family dwelling which has a kitchen added on the second floor to convert it to two families. This should be listed as one family plus one conversion. Another example is the old superior quality of home which perhaps now accommodates five families. This would be listed as one family plus four conversions.

In listing flats and conversions bear in mind that a house or building can be converted from its original design sufficiently to become a flat.

Some variations in listing may be as follows:

- Single family plus "x" conversions
- Two family flat plus "x" conversions
- Duplex plus two family flat
- Duplex plus "x" conversions
- Three family flat

It should be noted that the addition for a flat and duplex is approximately double that of a conversion. The additional value is basically for kitchen cabinets, extra closets, extra partitions, rough plumbing, etc.

#### 2. Foundation

Check proper box or write-in if something other.

#### 3. Basement Area

Circle proper amount of basement. This refers only to basement under the main body of the house. Basement area under additions should be listed in sketch area with additions.

LISTING INSTRUCTIONS (Continued)

4. Exterior Walls

Check proper box or write-in if something other.

5. Roof

Check proper box or write-in if something other. (See “roof types” for additional information.)

6. Floors

Check proper box or boxes for each floor. Do not try to find percentage of different types of flooring. (Except part earth floor in basement.)

7. Interior Finish

Check proper box or boxes for each floor. Do not try to find percentage of different types of interior finish.

8. Rooms

Write in total number of finished rooms on each floor and the number of bedrooms on each floor. (Do not count bathrooms, toilet rooms, pantries, breakfast nooks, etc.)

9. Basement Finish

First check or write-in what the finished area is used for. Next enter the amount of finish. This can be in percentage or square feet. If interior finish cannot be adequately described in the check boxes, use “remarks”. Basement finish is field priced. If there is a basement garage, circle proper number.

10. Attic Finish

Circle amount of attic finish or check floor and stairs. (See “story heights” for additional details.)

11. Heating

First check proper box for type of heating system, next check or write-in the energy source for the system. Air conditioning is also a check under this heading.

12. Plumbing

Write in number after each line. (Do not use check marks.) One sink is considered as base and all “extra” sinks should be listed. Stall showers have ceramic tile or equivalent in the shower. All other showers (metal, block, plywood, etc.) should be marked with an “M”.

13. Tiling

Write in number after each item. (Do not use check marks.) If only part of the item exists, mark out the part that is not there. Example: If a bathroom has ceramic wainscot but not flooring, place a line through fl. If tiling is plastic or equivalent, place a “p” after the item. Tiling is a descriptive item only.

## LISTING INSTRUCTIONS (Continued)

### 14. Fireplaces

Write in number after each item. (Do not use check marks.) Fireplace and stack refers to a wood burning fireplace with a chimney. If one chimney has two fireplaces, it would be one fireplace and stack and one fireplace extra. Prefabricated fireplaces do not have a chimney or special foundation under the fire place (metal flue only). Gas fireplaces with a vertical vent should be listed as a prefabricated and should be marked "gas-vert." Gas fireplaces with a side vent should be listed as a prefabricated and should be marked "gas-side". Artificial fireplaces are not a pricing item and should be listed for description only. Place "art" on card. If the main structure is 1½ or 2 story but the fireplace is in a 1 story addition, note so on the card.

### 15. Other Features

Modern kitchen should be checked if the kitchen meets modern standards and/or if the kitchen in an older home has been modernized.

Built-in features may be checked in single family dwelling but should be listed with numbers in multi-family units.

Security systems, built-in vacuums, intercom systems and built-in stereos should be listed under this heading. Built-in barbecues should be priced as an extra fireplace.

### 16. Obsolescence

This item is to be used only if the property received some recognition for obsolescence. Generally this item is used by the review assessor/appraiser.

### Garages

Attached garages must have a minimum of one-third of the common wall adjoining the main body of the house or addition. Garages attached only to porches and breezeways should normally be listed as detached. Lister has option to indicate otherwise.

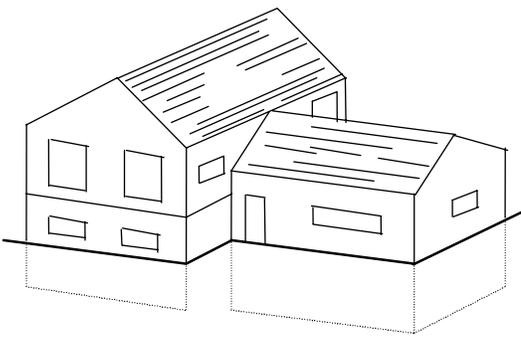

SPLIT LEVEL AND SPLIT FOYER DWELLINGS

In listing split level dwellings, the assessor/appraiser must “envision” the structure as having a single roof-line. This is done by mentally “sinking” the higher portion until the roof line is straight. The result is usually one story and basement dwelling. Because of the added cost of building a split level the assessor/appraiser should add 5% to 15% to his normal grade, depending on the complexity of the structure.

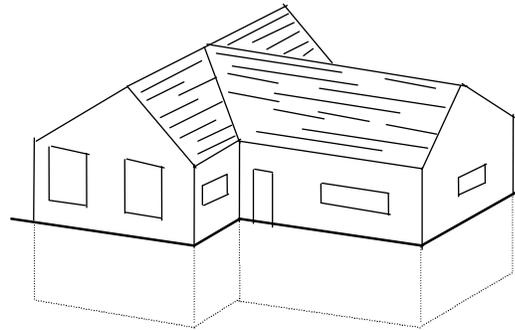

Listing a split foyer is merely sinking the entire building so that the half submerged section is fully submerged and therefore becomes a basement. (Field price basement finish.) It is often necessary to add 5% to 15% to the normal grade.

Following are several demonstrations of the “actual structure” with accompanying demonstrations of how it should be “envisioned” by the assessor/appraiser.

Note: If the lower level is 100% above grade, it should be priced as a first floor.

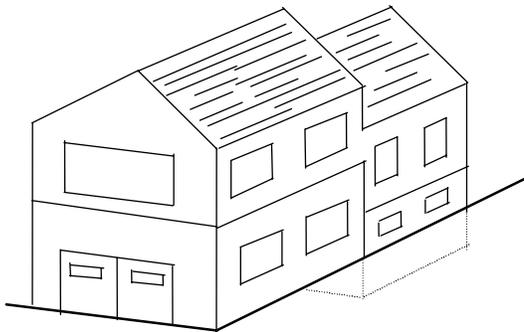

ACTUAL STRUCTURE

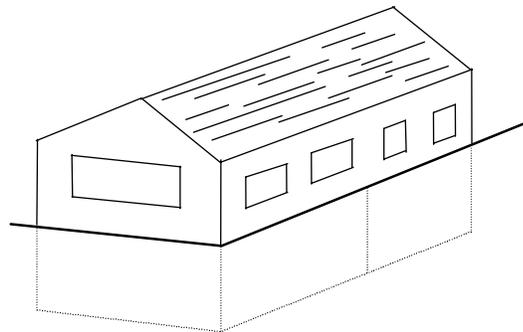

SPLIT LEVEL

ENVISIONED STRUCTURE

List as a one story and basement dwelling. (Field price basement finish.)

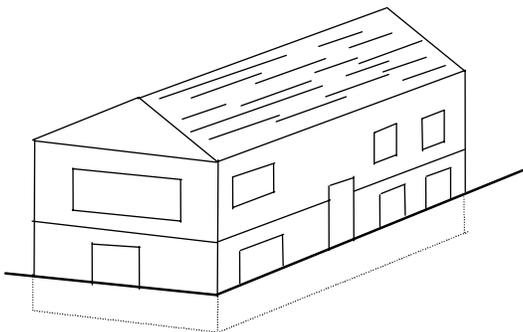

ACTUAL STRUCTURE

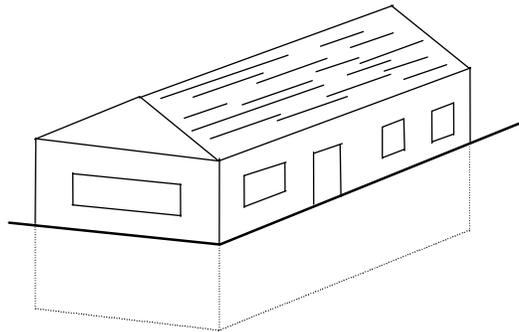

SPLIT LEVEL

ENVISIONED STRUCTURE

List as a one story and basement dwelling. (2 car basement garage.) (Field price basement finish.)

ACTUAL STRUCTURE

SPLIT FOYER

ENVISIONED STRUCTURE

List as a one story and basement dwelling. (Field price basement finish.)

GAMBREL

SHED

## STORY HEIGHTS

Story height listing must conform to the schedule make-up. Therefore, it is necessary for the assessor/appraiser to know the percent of finish represented by each story height designation. Each percentage is in relationship to ground area of the main body of the home.

<u>Percent of Finish</u>	<u>Listing Designation</u>
Floor & stairs only	Unfinished attic
20% to 30%	1/4 attic
30% to 40%	1/2 attic
40% to 50%	3/4 attic
50% to 60%	Full attic
60% to 80%	1/2 story
80% to 90%	3/4 story

Example: Main body of the home is 24' x 34' or 816 S.F. On the second level there is 370 S.F. (45%) of finished area. This should be listed as one story plus three quarter finished attic. If there were 570 S.F. (70%) of finished area on the second level, it would be listed as one and a half stories high.

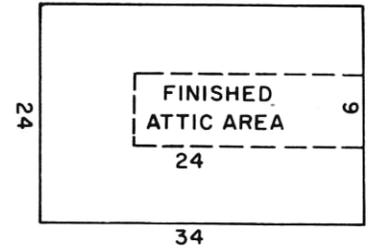

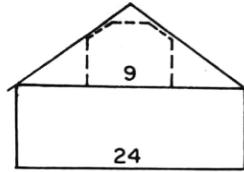

Note: There is no special price for a one and three quarter story building. The base price for this height must be interpolated between the one and a half story and two story. All additions and deductions from base are taken from the two story schedule. Most assessor/appraisers will suggest on a one and three quarter story dwelling that it be priced as a two story because of the small (if any) savings in construction costs.

Good judgment must be used in determining the amount of finish chargeable on the upper level. Do not consider any area not having 5' 0" of height on the side wall as finished (even if the slope is finished to where it meets the floor). Room layout will be an influencing factor in designating the amount of finish. If you have 40% of the second level finished, there may be a question whether to indicate half attic or three quarter attic. If this is all one dormitory type room definitely drop to half attic, however, if it is two bedrooms and a bath you should place the three quarter attic finish on your listing card.

Always remember, you are relating to replacement cost and the greater percentage of finish you designate, the more money your schedule is going to give you.

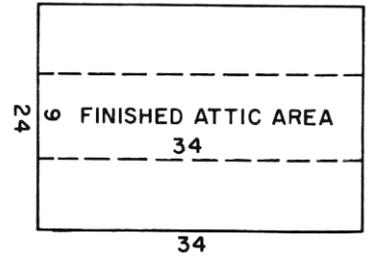

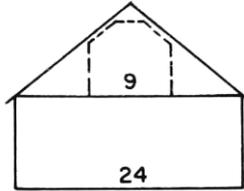

On the following page are demonstrations of various amounts of finished upper floors and how they should be listed.

1<sup>s</sup> + 1/4 FINISHED ATTIC

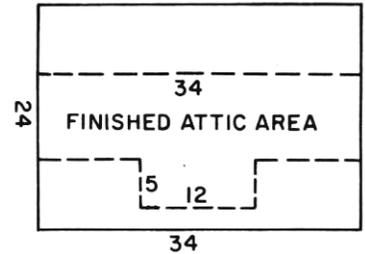

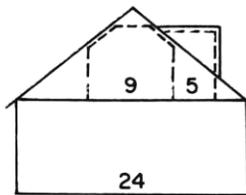

Main Body = 816 S.F. - Finished Attic Area = 216 S.F. - Approximately 26% Finished

1<sup>s</sup> + 1/2 FINISHED ATTIC

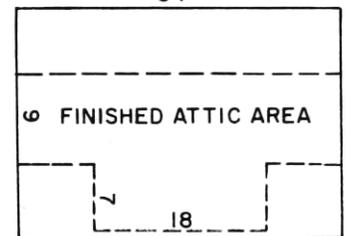

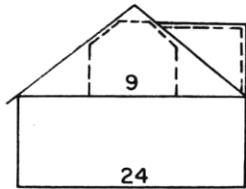

Main Body = 816 S.F. - Finished Attic Area = 306 S.F. - Approximately 37% Finished

1<sup>s</sup> + 3/4 FINISHED ATTIC

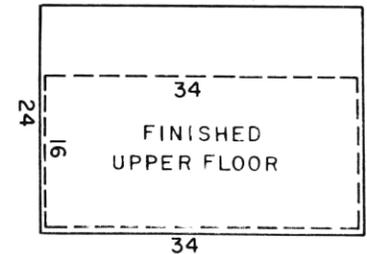

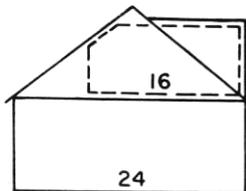

Main Body = 816 S.F. - Finished Attic Area = 366 S.F. - Approximately 45% Finished

1<sup>s</sup> + FULL FINISHED ATTIC

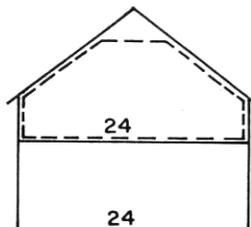

Main Body = 816 S.F. - Finished Attic Area = 432 S.F. - Approximately 53% Finished

1½ STORY  
(By use of dormers)

Main Body = 816 S.F. - Finished Attic Area = 544 S.F. - Approximately 67% Finished

1½ STORY  
(Conventional)

## PRICING INSTRUCTIONS

- a. Compute all areas and enter on card under "computations".
- b. Check story height and type of construction. Get figure from "base cost" and enter opposite area.
- c. Enter prices for all additions, porches, stoops, garages, etc., opposite the related areas.
- d. Enter all necessary additions and deductions in the appropriate space. (See pricing supplement.)
- e. Add and subtract all figures in "value" column.
- f. Enter grade adjustment from schedule and multiply times total, enter results in "total replacement" space. Transfer "total replacement" to top of card.
- g. Subtract physical depreciation from 100% to arrive at percent good, multiply this figure times "total replacement" and enter results in physical value.
- h. If there is an obsolescence factor follow the same procedure as "g" to arrive at "actual value". If there is no obsolescence repeat the physical value in the actual value column.
- i. Calculate detached garages and outbuildings (if any) and total card.

## PRICING SUPPLEMENT

1. Occupancy One family is base. All additional families are added for as listed. See "multi-family" on addition and deduction page.
2. Foundation This is a descriptive item only. No adjustments necessary.
3. Basement Area Full basement is base. Find adjustment for "no basement" or "1/2 basement" adjacent to "base cost". 1/4 basement - use 1/2 basement deduction. 3/4 basement consider as full (base). Dirt floor in basement - subtract \$3.65 per square foot of area with dirt floor. Basement finish should always be field priced.
4. Exterior Walls Use proper base cost column (frame, brick, or log). The following walls are considered to be frame or equivalent: siding and sheathing, shingles, aluminum siding, steel siding, vinyl siding, stucco, concrete block, and tile.  
  
Brick veneer, brick on tile or block, and solid brick are priced as brick.  
  
Part brick, EIFS, or stone and part frame - use frame "base cost" and add for linear feet of brick, EIFS, or stone from "wall facing" on addition and deduction page.  
  
Stone or EIFS - price as frame, add for linear feet of stone or EIFS from "wall facings" on addition and deduction page.
5. Roof Descriptive item only. All roof types and coverings are base.

PRICING SUPPLEMENT (Continued)

6. Floors Descriptive item only. All floors and floor coverings are base except as noted under "basement area".
7. Interior Finish Plaster, drywall, and paneling are base. Basement interior finish is field priced.
8. Rooms Descriptive item only.
9. Basement Finish All basement finish is field priced excepting basement garages. See addition and deduction page.
10. Attic Finish No attic is base. Add for attic floor and stairs or attic finish from "attic" schedule. Price pull down stairs with floor same as "floor & stairs".

Stairs only - No charge.

11. Heating Forced hot air is base. Gravity is equivalent to base.

Two furnaces - No additional charge.

GEO-Thermal Heating - Add \$4.00 P.S.F. and list under heating (see additions & deductions page).

Hot water or electric heating systems are descriptive items only. Solar heating, heat pumps, and auxiliary heating systems are considered base.

Floor furnace, wall furnace, and pipeless furnace - Subtract for no heating from the "base cost" line and add for type of furnace from addition and deduction page.

Hand fired coal furnace - Deduct from addition and deduction page.

Floor or wall furnace in addition to base heating system - No charge.

Stoker furnace - Base to the heating system used.

Steam heating - Same as hot water.

City steam - Base.

Air conditioning is added for from "base cost" line (add air conditioning price for heat pump systems).

If only 1 story is air conditioned on a 1½ or 2 story house, get addition price from 1 story "base cost" line.

Air conditioning for additions: If total of all floor areas is under 1200 S.F. do not add for air conditioning in additions. If floor area of main structure is 1200 S.F. or more add for air conditioning in additions from "Additions" page. If total of main area and additions exceed 1200 S.F. add for difference from "Additions" page.

Note: To determine floor area on a 1½ story dwelling multiply ground area x 170%, on a 2 story dwelling multiply ground area x 200%. In calculating "total floor" area do not include additions for which air conditioning would not normally be added.

12. Plumbing Base plumbing is as follows:
  - sewer and water
  - one three-fixture bathroom
  - one kitchen sink
  - one hot water tank

Any variation in plumbing should be added or subtracted from addition and deduction page. All showers marked with "M" should be priced as prefabricated.

"Sewer and water only" does not assume sink. "Water only" does not assume a sink.

PRICING SUPPLEMENT (Continued)

13. Tiling Tiling is an optional pricing item (if a jurisdiction chooses to add for tiling, see Analyzed Unit Cost section for prices).

14. Fireplace No fireplace is base.

Add for fireplaces from addition and deduction page.

Artificial fireplace is descriptive only. No charge.

15. Other Features No built-in features are base. Add for built-in from addition and deduction page.

Built-in incinerators and disposals are descriptive only. No charge.

Built-in barbecues are priced as "extra fireplace".

Bay Windows If less than one full story in height, no charge. If bay window is a full one story in height, price as a one story.

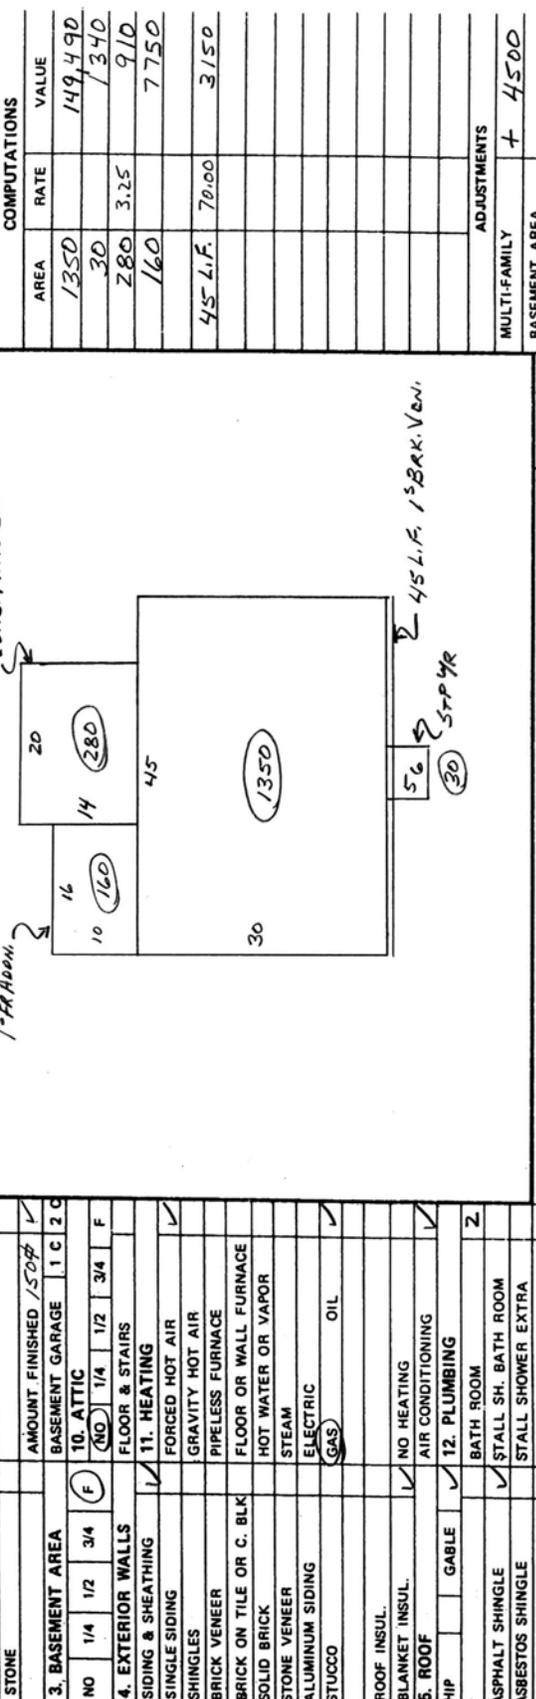

Overhangs Price as addition if not tied into main area.

Breezeways Price as porch.

EXTERIOR ITEMS

	Price Range	Typical	
Yard Sprinkler System	\$0.36 - \$0.54	\$0.45	P.S.F.

BASEMENT FINISH

	Price Range	Typical	
Floor Covering	\$2.75 - \$4.25	\$3.50	P.S.F.
Ceilings	1.75 - 2.75	2.25	P.S.F.
Wall Finish (Interior of Exterior Wall)	27.00 - 40.00	33.50	P.L.F.
Partitions (1 Side)	35.00 - 52.00	43.50	P.L.F.
Partitions (2 Sides)	49.00 - 74.00	61.50	P.L.F.
Lighting	1.30 - 1.90	1.60	P.S.F.
Heating	1.20 - 1.80	1.50	P.S.F.
Air Conditioning	1.10 - 1.70	1.40	P.S.F.
Finished Stairway	650.00 - 950.00	800.00	Each

TYPE FINISH

	Price Range	Typical	
Recreation Room Finish (Single Room)	\$13.50 - \$20.50	\$17.00	P.S.F.
Recreation Room Finish w/Walk-Out Bsmt.	16.00 - 24.00	20.00	P.S.F.
Living Quarters Finish (Multiple Rooms)	17.50 - 25.50	21.50	P.S.F.
Living Quarters Finish w/Walk-Out Bsmt.	21.00 - 31.00	26.00	P.S.F.
Walk-Out Basement (P.L.F. of Exposed Wall)	65.00 - 90.00	77.50	P.L.F.

Notes: Walk-out basement price includes doors, windows and interior finish on exposed exterior wall.  
 Use low range for low quality finish and large rooms.  
 Use high range for good quality finish, small rooms or areas with a large amount of partitioning.  
 All extras and built-ins must be priced separately.  
 Add for basement finish only if it adds to the resale value of the house.

FIELD PRICING SCHEDULE

SHEDS (P.S.F.)

	Price Range		Typical
Metal Storage Sheds	\$7.00	- \$11.00	\$9.00
